Item No. 4.42

Preamble

This syllabus is an honest attempt to include following ideas, among other things, into practice:

- Bring a new approach to syllabus, not a revision of the existing syllabus.
- Create a unique identity for MSc in Comp Science distinct from similar degrees in other related subjects.
- Recommend provision for specialization in MSc Computer Science degree.
- Offers focus on core Computer Science subjects.
- Incorporate advanced and most recent trends.
- Identify and nurture research temper among students.
- Offer provision for internship with industry.
- Focus, as far as possible, only on open source software.

This syllabus for the semester I and semester II has tried to initiate steps to meet these goals. By extending the syllabus to semester III and semester IV, it is assumed that these goals will be met to a larger extent.

The syllabus proposes to have four core compulsory courses in semester I. Semester II proposes two compulsory courses and two elective courses. Each elective has two tracks of courses based on a recent and emerging area. It is expected that a student continues to take that track for each elective in the semester III and specializes in one of those in the semester IV.

In order to give an impetus to research among students, one of the courses in semester I gives an overview on how to do research in Computer Science. Provision for case study in the practical course of the elective in the semester II is an attempt to translate that theory into practice. It is assumed that, with this back ground, a student can take up a challenging research project in the semester III and semester IV.

In a nutshell, the core philosophy of the syllabus is to (i) give strong foundation on core Computer Science subjects;(ii) expose the student to emerging trends in a gradual and incremental way; (iii) offer specialization on a chosen area (iv) create a research temper among students in the whole process; (v) prepare student community for the demands of ICT industry.

We hope that the student and teaching community will appreciate the thrust, direction and treatment given to the courses in the syllabus. We sincerely believe that a student who takes up this course will be better fit for industry as he or she will have strong foundation on fundamentals and exposure to advanced and emerging trends. We earnestly believe that by focusing on student driven research, learning will be more interesting and stimulating.

We thank all the industry experts, senior faculties and our colleagues department of Computer Science of different colleges as well as University of Mumbai; who have given their valuable comments and suggestions, which we tried to incorporate. We thank the Chairperson and members of the Adhoc Board of Studies in Computer Science of University for their faith in us. Thanks to one and all who have directly or indirectly helped in this venture.

Structure of the syllabus

This is the syllabus for the semester –I and semester –II of MSc Computer Science program of University of Mumbai to be implemented from the year 2015-2016. The syllabus offers four theory courses and two practical courses each in each semester. One noteworthy feature of the syllabus is the introduction of Electives in different tracks in the semester II. Each elective has two tracks (track A and track B for elective I and track C and track D elective II). It is assumed that a student will continue with that track in the semester III and choose only one elective in the semester IV, the subject in which he or she wants to specialize in.

Semester I

The syllabus proposes four subjects in semester -I. Each subject has theory and practical components.

Semester –I: Theory courses

The four theory courses offered in semester I are:

- (i) Analysis of Algorithms and Researching Computing
- (ii) Advanced Networking Concepts
- (iii) Advanced Database Systems and
- (iv) Robotics & Artificial Intelligence.

Each of these courses is of four credits each and is expected to complete in 60 hours. The following table gives the details of the theory courses in Semester -I.

Semester – I: Theory courses

Course	Course Title	No of	Credits
code		hours	
PSCS101	Analysis of Algorithms and Researching	60	04
	Computing		

PSCS102	Advanced Networking Concepts	60	04
PSCS103	Advanced Database Systems	60	04
PSCS104	Robotics and Artificial Intelligence	60	04
Total Credits for Theory courses in Semester -I			16

Semester –I: Practical Lab courses

The syllabus proposes two laboratory courses of 4 credits each. The laboratory experiments from first two theory courses (PSCS101 and PSCS102) are combined together and are proposed as the first practical course (PSCSP101). Similarly, the laboratory experiments from the last two theory courses (PSCS103 and PSCS104) are combined together and called as the second practical course (PSCSP102). As far as the practical are concerned, equal weightage similar to that of theory courses has been given in terms of the number of hours. The following table summarizes the details of the practical courses in the semester I.

Course	Course Title	No of	Credits
code		hours	
PSCSP101	Analysis of Algorithms & Researching Computing	60+60=	04
	and Advanced Networking Concepts	120	
PSCSP102	Advanced Database Systems and	60+60=	04
	Robotics & Artificial Intelligence	120	
Total Credits for Practical Laboratory courses in Semester –I			08

Semester I – Practical Laboratory courses

Semester –II

The syllabus proposes four subjects in semester –II also. As in the case of semester –I, each subject has theory and practical components.

Semester II- Theory courses

The four theory courses offered in semester II are

(i) Advanced Operating Systems

(ii) Design and implementation of Modern Compilers

(iii) Elective - I

(a) Track A: Cloud Computing – I (Concepts and Design of Web services)

- (b) Track B: Cyber and Information Security I (Network Security)
- (iv) Elective II
 - (a) Track C: Business Intelligence and Big Data Analytics I (Business Intelligence)
 - (b) Track D: Machine Intelligence I (Fundamentals of Machine Intelligence)

A student can take either track A or track B from Elective – I. Similarly one can take either track C or track D from Elective – II. Each of these courses (compulsory as well as elective) is of four credits each and is expected to complete in 60 hours. The details are shown in the following table.

Course	Course Title	No of	Credits
code		hours	
PSCS201	Advanced Operating Systems	60	04
PSCS202	Design and implementation of Modern Compilers	60	04
PSCS2031	Elective I- Track A: Cloud Computing (Concepts		
	and Design of Web services)	60	04
PSCS2032	Elective I- Track B: Cyber and Information		
	Security (Network Security)		
PSCS2041	Elective II - Track C:Business Intelligence and Big		
	Data Analytics (Business Intelligence)	60	04
PSCS2042	Elective II - Track D: Machine Intelligence		
	(Fundamentals of Machine Intelligence)		
Total Credits	for Theory courses in Semester II		16

Semester II – Theory courses

Semester –II: Practical Laboratory courses

The syllabus proposes two laboratory courses of 4 credits each. The laboratory experiments from the first two theory courses (PSCS201 and PSCS202) are combined together and are proposed as the first practical course (PSCSP201). Similarly, the laboratory experiments from the elective courses are combined together and taken as the second practical course (PSCSP202). The following table summarizes the details of the practical courses in the semester –II.

Course	Course Title	No of	Credits
code		hours	
PSCSP201	Analysis of Algorithms & Researching Computing	60+60=	04
	and Advanced Networking Concepts	120	
PSCSP202	Elective I and Elective II	60+60=	04
		120	
Total Credits for Practical Laboratory courses in Semester –II			08

Semester II – Practical Laboratory courses

Case study: The syllabus proposes a case study under the lab course on Elective -I and Elective - II (PSCSP202). A student is expected to select a topic related to his or her chosen track belonging to either Elective -I or Elective- II and make a case study report. It is expected that the student refers at least five research papers in the process of making the case study. By introducing the case study in the second semester, the syllabus prepares a student to take up a research project in the semester III and semester IV.

Detailed syllabus of semester – I

Course Code	Course Title	Credits	
PSCS101	Analysis of Algorithms and Researching Computing	04	
Unit I: Design strategies			

The Role of Algorithms in Computing: Algorithms as a technology. Getting Started: Insertion sort, Analyzing algorithms, Designing algorithms. Growth of Functions: Asymptotic notation, Standard notations and common functions. Divide-and-Conquer: The maximum-subarray problem, Strassen's algorithm for matrix multiplication, The substitution method for solving recurrences. Probabilistic Analysis and Randomized Algorithms: The hiring problem, Indicator random variables, Randomized algorithms.

Unit II: Advanced Design and Analysis Techniques

Dynamic Programming: Rod cutting, Elements of dynamic programming, longest common subsequence. Greedy Algorithms: An activity-selection problem, Elements of the greedy strategy, Huffman codes. Elementary Graph Algorithms: Representations of graphs, Breadth-first search, Depth-first search. Minimum Spanning Trees: Growing a minimum spanning tree, Algorithms of Kruskal and Prim. Single-Source Shortest Paths: The Bellman-Ford algorithm, Single-source shortest paths in directed acyclic graphs, Dijkstra's algorithm.

Unit III: Number-Theoretic Algorithms and NP – Completeness

Elementary number-theoretic notions, Greatest common divisor, Modular arithmetic, Solving modular linear equations, The Chinese remainder theorem, Powers of an element, The RSA public-key cryptosystem NP-Completeness: Polynomial time, Polynomial-time verification, NP-completeness and reducibility, NP-complete problems. Approximation Algorithms: The vertex-cover problem, The traveling-salesman problem, The set-covering problem, subset-sum problem.

Unit IV: Researching Computing

Introduction, purpose and products of research, overview of research process, internet research, participants and research ethics, reviewing literature, design and creation, experiments, Quantitative data analysis, presentation of research.

Course Code	Course Title	Credits
PSCS103	Advanced Database Systems	04

Unit I: Distributed Database Concepts

Definition of Distributed databases and Distributed Database Management System (DDBMS), Distributed transparent system. DDBMS Architecture: DBMS standardization, Global, Local, External, and Internal Schemas, Architectural models for DDBMS. Distributed database design: Design problem of distributed systems, Design, strategies (top-down, bottom-up), Fragmentation, Allocation and replication of fragments. Query Processing Overview, Query Optimization.

Unit II: Transaction Processing in Distributed databases and Parallel databases Transaction Management: Definition and examples, formalization of a transaction, ACID properties, classification of transaction. Concurrency Control: definition, execution schedules, examples, locking based algorithms, timestamp ordering algorithms, deadlock management. DBMS reliability: Definitions and Basic Concepts, Local

Recovery Management, In-place update, out-of-place update, Distributed Reliability Protocols, Two phase commit protocol, Three phases commit protocol. Parallel Database System: Definition of Parallel Database Systems. Parallel query evaluation: Speed up and scale up, Query Parallelism: I/O Parallelism (Data Partitioning) Intraquery Parallelism, Inter –Query Parallelism, Intra Operation Parallelism, Inter Operation Parallelism.

Unit III: Object Oriented, Temporal and Spatial Databases:

Object Oriented Database: Object Identity, Object structure, Type Constructors, Encapsulation of Operations, Methods, Persistence, Type and Class Hierarchies, Inheritance, Complex Objects, Object-oriented DBMS, Languages and Design: ODMG Model, Object Definition Languages (ODL), Object Query Languages (OQL). Temporal and Spatial Database: Introduction to Temporal Database: Time ontology, structure, and granularity, Temporal data models, Temporal relational algebras. Introduction to Spatial Database: Definition, Types of spatial data, Geographical Information Systems (GIS), Conceptual Data Models for spatial databases, Logical data models for spatial databases: rastor and vector model. Physical data models for spatial databases: Clustering methods (space filling curves), Storage methods (R-tree). Query processing.

Unit IV: Deductive, Active, Multimedia and XML Databases

Deductive Database: Introduction to recursive queries, Datalog Notation, Clause Form and Horn Clauses, Interpretation of model: Least Model semantics, The fixed point operator, safe Datalog program, recursive query with negation. Active Database: Languages for rule specification: Events, Conditions, Actions. XML and Database: Structure of XML Data, XML Document Schema, Querying and Transformation, Storage of XML Data. Introduction to multimedia database systems.

Course Code	Course Title	Credits
PSCS104	Robotics and Artificial Intelligence	04
The feature from the Definition		

Unit I: Introduction to Robotics

What is a Robot? Definition, History of Robots: Control Theory, Cybernetics, Grey Walter Tortoise, Analog Electronic Circuit, Reactive Theory, Braitenberg's Vehicle, Artificial Intelligence, Vision Based Navigation, Types of Robot Control. Robot Components: Embodiment, Sensors, States, Action, Brains and Brawn, Autonomy, Arms, Legs, Wheels, Tracks, and What really drives them effectors and actuators: Effector, Actuator, Passive and Active Actuation, Types of Actuator, Motors, Degree of freedom Locomotion: Stability, Moving and Gaits, Wheels and Steering, Staying on the path. Manipulators: Endeffectors, Teleoperation, Why is manipulation hard? Sensors: Types of Sensors, Levels of Processing, Passive and Active sensors, Switches, Light sensors, Resistive position sensor.

Unit II: Sonar, Lasers and Cameras:

Ultrasonic and Sonar sensing, Specular Reflection, Laser Sensing, Visual Sensing, Cameras, Edge Detection, Motion Vision, Stereo Vision, Biological Vision, Vision for Robots, Feedback or Closed Loop Control: Example of Feedback Control Robot, Types of feedback control, Feed forward or Open loop control.

Unit III: Languages for Programming Robot:

Algorithm, Architecture, The many ways to make a map, What is planning, Cost of planning, Reactive systems, Action selection, Subsumption architecture, How to sequence behavior through world, hybrid control, Behavior based control and Behavior Coordination, Behavior Arbitration, Distributed mapping, Navigation and Path planning.

Unit IV: Artificial Intelligence

Introduction, State space search: Generate and test, Simple search, Depth First Search (DFS), Breadth First Search (DFS), Comparison and quality of solutions. Heuristic Search: Heuristic functions, Best First Search (BFS), Hill Climbing, Local Maxima, Beam search, Tabu search. Finding Optimum paths: Brute force, branch & bound, refine search, Dijkstra's algorithm, A* algorithm. Admissibility of A* algorithm.

Course Code	Course Title				
PSCS202	Design and implementation of Modern Compilers	04			
Unit I: Introduction to Compilers					
-	f a committee A circula commande to the decise of lowing				

The structure of a compiler, A simple approach to the design of lexical analyzers, Regular expressions, Finite automata, From regular expressions to finite automata, Minimizing the number of states of a DFA, Context-free grammars, Derivations and Parse trees, Parsers, Shift-reduce parsing, Operator-precedence parsing, Top- down parsing, Predictive parsers.

Unit II: Automatic Construction of Efficient Parsers

LR parsers, The canonical collection of LR(0) items, Constructing SLR parsing tables, Constructing canonical LR parsing tables, Constructing LALR parsing tables, Using ambiguous grammars, An automatic parser generator, Implementation of LR parsing tables, Constructing LALR sets of items.

Unit III: Advanced syntax analysis and basic semantic analysis

Syntax-directed translation schemes, Implementation of syntax-directed translators, Initial introduction to the ongoing Tiger compiler, bindings for the Tiger compiler, typechecking expressions, type-checking declarations, activation records, stack frames, frames in the Tiger compiler, translation to intermediate code, intermediate representation trees, translation into trees, declarations, basic blocks and traces, taming conditional branches, liveness analysis, solution of dataflow equations, liveness in the Tiger compiler, interference graph construction.

Unit IV: Dataflow analysis and loop optimization

The principle sources of optimization, Loop optimization: The DAG representation of basic blocks, Dominators, Reducible flow graphs, Depth-first search, Loop-invariant computations, Induction variable elimination, Some other loop optimizations. Dataflow Analysis: intermediate representation for flow analysis, various dataflow analyses, transformations using dataflow analysis, speeding up dataflow analysis, alias analysis.

Course Code	Course Title	Credits
PSCS2032	Elective I - Track B: Cyber and Information Security	04
	(Network and Communication Security)	

Unit I: Computer Security

Principles of Security, Different Attacks: malicious and non-malicious program, Types of Computer Criminals. Operating System Security: Protected objects and methods of protection. Memory address protection: Fence, Relocation, Base/Bound Registers, Tagged Architecture, Segmentation, Paging, Directory, access control list. Database Security: Security requirements, Integrity, Confidentiality, Availability, Reliability of Database, Sensitive data, Multilevel database, Proposals for multilevel security.

Unit II: Network Security

Different types of network layer attacks, Firewall (ACL, Packet Filtering, DMZ, Alerts and Audit Trials) – IDS,IPS and its types (Signature based, Anomaly based, Policy based, Honeypot based). Web Server Security: SSL/TLS Basic Protocol-computing the keys- client authentication-PKI as deployed by SSL Attacks fixed in v3- Exportability-Encoding-Secure Electronic Transaction (SET), Kerberos.

Unit III: Cloud Security

How concepts of Security apply in the cloud, User authentication in the cloud; How the cloud provider can provide this- Virtualization System Security Issues: e.g. ESX and ESXi Security, ESX file system security- storage considerations, backup and recovery-Virtualization System Vulnerabilities, security management standards- SaaS, PaaS, IaaS availability management- access control- Data security and storage in cloud.

Unit IV: Mobile Security:

Mobile system architectures, Overview of mobile cellular systems, GSM and UMTS

Security & Attacks, Vulnerabilities in Cellular Services, Cellular Jamming Attacks & Mitigation, Security in Cellular VoIP Services, Mobile application security. Securing Wireless Networks: Overview of Wireless Networks, Scanning and Enumerating 802.11 Networks, Attacking 802.11 Networks, Bluetooth Scanning and Reconnaissance, Bluetooth Eavesdropping, Attacking & Exploiting Bluetooth, Zigbee Security & Attacks.

Course Code	Course Title				
PSCS2041	Elective II - Track C: Business Intelligence and Big	04			
	Data Analytics (Business Intelligence)				
Unit I: Introduction to Business Intelligence					

Operational and Decision Support System, Data-Information-Knowledge-Decision making-Action cycle. Basic definitions- Business Intelligence; Data warehousing, Business Intelligence architecture, Use and benefits of Business Intelligence. Knowledge Discovery in Databases: KDD process model, Data Pre-processing: Cleaning: Missing Values; Noisy Values; Inconsistent values; redundant values. Outliers, Integration, transformation, reduction, Discretization: Equal Width Binning; Equal Depth Binning, Normalization, Smoothing.

Unit II: Introduction to Business Data Warehouse

Definition of Data warehouse, Logical architecture of Data Warehouse, Data Warehouse model- Enterprise warehouse; Data Marts; Virtual warehouse. Populating business Data Warehousing: data integration and extract, transform, load (ETL).

Unit III: Designing Business Data Warehouse

OLTP and OLAP systems, Designing business information warehouse: Principles of dimensional modeling, Data cubes, Data cube operations, data cube schemas.

Unit IV: Introduction to Data Mining

Data mining definitions and process: business and data understanding. Association Analysis: Definition of association rule, General issues: Support; Confidence; Lift; Conviction, Frequent Item sets: APriori Algorithm; Issues with APriori Algorithm, Data structures: Hash tree and FP tree.

Text book:

Course Code	Course Title	Credits
PSCS2042	Elective II - Track D: Machine Learning	04
	(Fundamentals of Machine Learning)	

Unit I: Learning-Standard Linear methods

Statistical Learning: What Is Statistical Learning, Assessing Model Accuracy. Linear Regression: Simple Linear Regression, Multiple Linear Regressions, Other Considerations in the Regression Model, The Marketing Plan, Comparison of Linear Regression with K-Nearest Neighbors. Classification: An Overview of Classification, Why Not Linear Regression?, Logistic Regression, Linear Discriminant Analysis, ,A Comparison of Classification Methods.

Unit II: Selection and improvements of linear learning methods

Resampling Methods: Cross-Validation, The Bootstrap. Linear Model Selection and Regularization: Subset Selection, Shrinkage Methods, Dimension Reduction Methods, Considerations in High Dimensions.

Unit III: Non-Linear Learning methods

Polynomial Regression, Step Functions, Basis Functions, Regression Splines, Smoothing Splines, Local Regression, Generalized Additive Models, Tree-Based Methods: The Basics of Decision Trees. Bagging, Random Forests, Boosting.

Unit IV: Support Vector machines, Principle Component Analysis and Clustering

Support Vector Machines: Maximal Margin Classifier. Support Vector Classifiers: Support Vector Machines, SVMs with More than Two Classes Relationship to Logistic Regression. Unsupervised Learning: The Challenge of Unsupervised Learning, Principal Components Analysis, Clustering Methods: K-Means Clustering, Hierarchical Clustering, Practical Issues in Clustering.

List of Practical Experiments for Semester –II

Cou	ourse Code Course Title Credits					
PSC	SP3	04				
	Design and implementation of Modern Compilers					
Sr		List of Practical Experiments on				
No	Advanced Operating Systems					
1	Port 17 is known as the 'Quote of the day service'. When a client connects to port					
	17 on a	server, the server responds with a quote for that day. Wr	ite a server			
	program	so that it delivers a quote of the day. The quotes should	be printable			
	ASCII cha	aracters and should contain fewer than 512 characters, altho	ugh multiple			
	lines are	e allowed. Since port 17 is considered well known an	d therefore			
	unavailat	ble, have your server listen to port 6017. Write the client co	ode used to			
	read the quotes returned by the server.					
2	Write a client-server application using Java sockets that allows a client to write					
	message (as a String) to a socket. A server will read this message, count the					
	number o	of characters and digits in the message, and send these two	counts back			
	to the cli	ent. The server will listen to port 6100. The client can obtai	n the String			
	message	that it is to pass to the server either from the command line	or by using			
	a prompt	to the user. One strategy for sending the two counts back to	the client is			
	for the se	erver to construct an object containing :				
	a. The m	essage it receives from the client				
	b. A cour	nt of the number of characters in the message				
	c. A coun	t of the number of digits in the message.				
3	Write a r	multithreaded Java program that outputs prime numbers. T	his program			
	should w	ork as follows: The user will run the program and will enter a	a number on			

	the command line. The program will then create a separate thread that outputs all
	the prime numbers less than or equal to the number entered by the user.
4	Servers can be designed to limit the number of open connections. For example, a
	server may wish to have only N socket connections open at any point in time.
	After N connections have been made, the server will not accept another incoming
	connection until an existing connection is released. Write Java programs to
	demonstrate the scenario
5	Assuming that a system has a 32-bit virtual address, write a Java program that is
	passed (1) the size of a page and (2) the virtual address. Your program will report
	the page number and offset of the given virtual address with the specified page
	size. Page sizes must be specified as a power of 2 and within the range 1024 —
	16384 (inclusive). Assuming such a program is named Address, it would run as
	follows:
	java Address 4096 19986
	and the correct output would appear as:
	The address 19986 contains:
	page number = 4
	offset = 3602.
6	Write a Java program that simulates the following disk-scheduling algorithms.
	Design separate classes that implement the following scheduling algorithms:
	a. FCFS
	b. SSTF
	c. SCAN
	d. C-SCAN
	e. LOOK
	Each algorithm will implement the following interface:
	public interface DiskScheduler
	{
	// service the requests
	// return the amount of head movement

	// for the particular algorithm
	public int serviceRequests();
	}
	The serviceRequests() method will return the amount of head movement required
	by the disk-scheduling algorithm.
7	Write a program that implements the FIFO and LRU page-replacement algorithms
	presented in this chapter. First, generate a random page reference string where
	page numbers range from 0 to 9. Apply the random page-reference string to each
	algorithm, and record the number of page faults incurred by each algorithm.
	Implement the replacement algorithms so that the number of page frames can
	vary as well. Assume that demand paging is used. Design and implement two
	classes—LRU and FIFO—that extend ReplacementAlgorithm. Each of these
	classes will implement the insert() method, one class using the LRU page-
	replacement algorithm and the other using the FIFO algorithm. Test your
	algorithm with suitable Java programs.
8	Using Worker thread write Android code for a click listener that downloads an
	image from a separate thread and displays it in an ImageView.
9	Write Android activity that includes each of the fundamental lifecycle methods.
10	Write Android application to demonstrate data storage with following options (any
	one can be asked in Practical examination):
	Shared Preferences (Store private primitive data in key-value pairs)
	Internal Storage (Store private data on the device memory)
	External Storage (Store public data on the shared external storage)
	SQLite Databases (Store structured data in a private database)
	Network Connection (Store data on the web with your own network server).
Not	e: The above practical experiments require following system requirements:
•	 Linux OS Ubuntu® 14.04 with following configurations (use 64 bit)
	GNOME or KDE desktop
	GNU C Library (glibc) 2.15 or later
	➤ 4 GB RAM

- Sufficient hard disk space
- > At least 1 GB for Android SDK, emulator system images, and caches
- > 1280 x 800 minimum screen resolution
- > Oracle® Java Development Kit (JDK) 7
- Android Studio.

	List of Experiments on Design and implementation of Modern Compilers
1	Write a program to convert the given NDFA to DFA.
2	Write a program to convert the given Right Linear Grammar to Left Linear
	Grammar form.
3	Write a program to illustrate the generation on SPM for the input grammar.
4	Write a program to illustrate the generation on OPM for the input operator
	grammar
5	Implement a simple program analyzer and interpreter for the straight-line
	programming language
6	Add semantic actions to your parser to produce abstract syntax for the MiniJava
	language together with a PrettyPrintVisitor
7	Design a set of visitors, which translate a MiniJava program into intermediate
	representation trees
8	Implement the translation to Assem instructions for your favorite instruction set
	(let µ stand for Sparc, Mips, Alpha, Pentium, etc.) using maximal munch.
9	Write a code to generate the DAG for the input arithmetic expression.
10	Write a program to demonstrate loop unrolling and loop splitting for the given
	code sequence containing loop.

2	Implement simple linear regression model on a standard data set and plot the least square regression fit. Comment on the result. [One may use inbuilt data sets like Boston, Auto etc] Implement multiple regression model on a standard data set and plot the least square regression fit. Comment on the result. [One may use inbuilt data sets like Carseats, Boston etc]. Implement multiple regression fit a classification model using following: (i) logistic regression (ii) Linear Discriminant Analysis (LDA) and (iii) Quadratic Discriminant Analysis (QDA) on a standard data set and compares the results. [Inbuilt datasets like Smarket,					

	Boston].
5	Use bootstrap to give an estimate of a given statistic. [Datasets like Auto, Portfolio
	and Boston etc may be used for the purpose].
6	For a given data set, split the data into two training and testing and fit the
	following on the training set:
	(i) Linear model using least squares
	(ii) Ridge regression model
	(iii) Lasso model
	(iv) PCR model
	(v) PLS model
	Report test errors obtained in each case and compare the results. [Data sets like
	College, Boston etc may be used for the purpose].
7	For a given data set, perform the following:
	(i) Perform the polynomial regression and make a plot of the resulting
	polynomial fit to the data.
	(ii) Fit a step function and perform cross validation to choose the optimal
	number of cuts. Make a plot of the fit to the data.
	[Use data set like Wage for the purpose].
8	For a given data set, do the following:
	(i) Fit a classification tree
	(ii) Fit a regression tree
	[One may choose data sets like Carseats, Boston etc for the purpose].
9	For a given data set, split the dataset into training and testing. Fit the following
	models on the training set and evaluate the performance on the test set:
	(i) Boosting
	(ii) Bagging
	(iii) Random Forest
	[Data sets like Boston may be used for the purpose].
10	Fit a support vector classifier for a given data set. [Data sets like Car, Khan,
	Boston etc may be used for the purpose].

11	Perform the following on a given data set:				
	(i) Principal Component Analysis				
	(ii) Hierarchical clustering.				
	[Data set like NC160, USArrests etc may be used for the purpose].				
Note	: The above practical experiments require the R Software.				

Scheme of Examination for Theory Courses

There will be an internal and external examination for the theory courses. The weightage of internal/external and scheme of examination will be as per common guidelines provided by the University for the PG courses in the faculty of Science.

Scheme of Examination for Practical Courses

There will not be any internal examination for practical courses.

External Examination for Practical Courses:

The particulars of the external examination for each practical course are given below:

Sr	Semester	Course	Particular	No of	Marks/	Total
No		Code		questions	question	Marks
1			Laboratory experiment			
			question with internal	2	40	80
	I		choice			
2		PSCSP1	Journal	-	10	10
3			Viva	-	10	10

Guidelines for Case Study in the Semester –II

The syllabus proposes introduction of a case study to be done by students in the semester –II. The objective of this step is to make learning more student-centric and to create a sense of involvement. Student can choose any topic related to one of the elective courses chosen by him or her. It is expected that the student refers to at least FIVE research papers as part of the case study. Working on a case study is expected to help the student to appreciate the coverage of the topics discussed in the 'Analysis of algorithms and researching computing' course studied in the semester I. This would also help the student to choose a good project topic and undertake a rigorous literature review needed for the project to be undertaken in the semester III and semester IV.

- > The case study can be taken by students individually or as a group of two.
- > The efforts for the case study should be spread over a period of at least 8 weeks.
- The case study should cover a topic related to one of the electives chosen by the student.
- Student should make a case study report of around 10-15 pages and submit during the practical examination.
- A presentation and viva based on the case study will be undertaken during the practical examination.

The following are some examples of case studies for each track. The list is only for illustration purpose and students are advised to choose a topic of their interest.

Elective – I: Track A: Cloud Computing

- Consumption of REST services in heterogeneous environment by an Android client.
- Service Oriented Architecture (SOA) approach to support heterogeneity, decentralization and fault tolerance in large distributed systems.
- Cloud security measures adopted in Elastic Compute Cloud (EC2) of Amazon Web Services (AWS).

Elective – I: Track B: Cyber and Information Security

- Game theoretic approach to shield collaborative wireless network.
- Application of emoticons in the area of cryptography.
- Digital Watermarking techniques for encryption and decryption

Elective – II: Track C: Business Intelligence and Big Data Analytics

- Assuming that you have been engaged to submit a blue print for the development of a data warehouse for an e-commerce company, make a project report detailing different steps to be taken for the purpose.
- Effectiveness of Hadoop as an open source companion to standard data warehouses.
- Emerging trends on cloud based business intelligence and analytics.

Elective – II: Track D: Machine Intelligence

- Machine intelligence approaches in stock market prediction.
- Recognizing Devnagri scripts using different machine intelligence techniques.
- Identify an area where support vector machines are used and discuss different approaches applied.

Guidelines for maintenance of journals:

A student should maintain a journal with at least ten practical experiments reported for each of the practical course. Related theory/algorithm need to be explained in journal. Certified journals need to be submitted at the time of the practical examination.
